Empirical and fitted copula

Average fitted Gumbel (G) contours

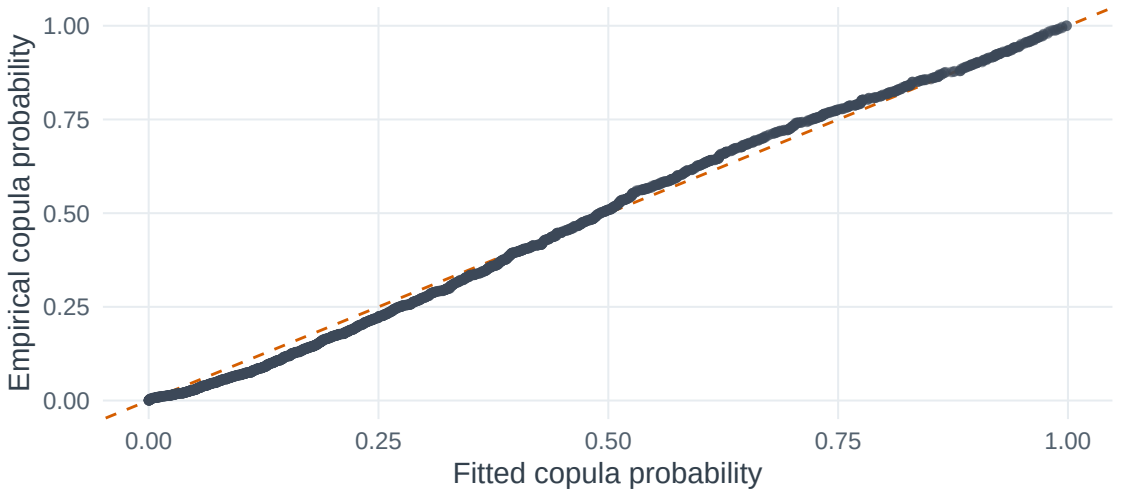

Observed vs Fitted Correlation by Quantile Bin

10 cuts formed from fitted copula strength

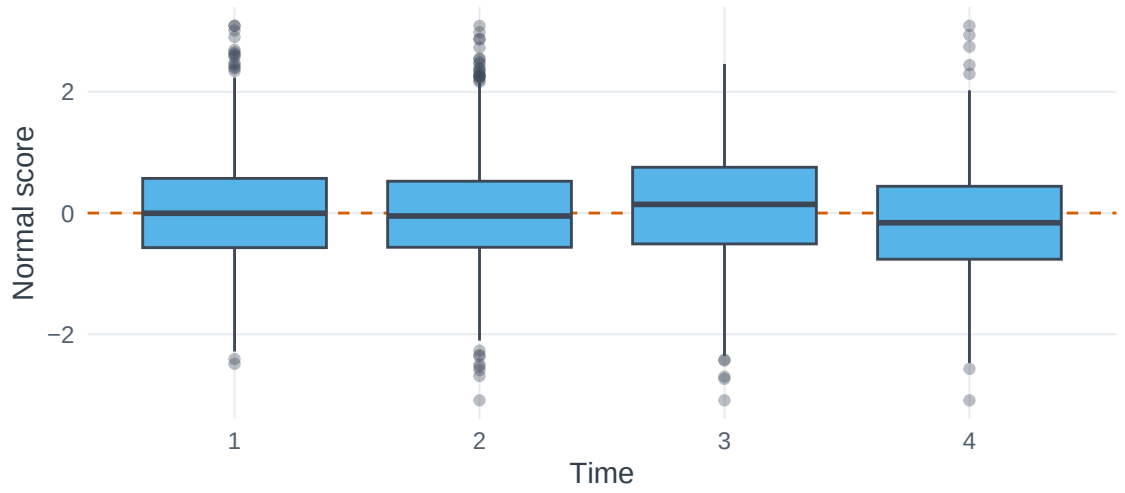

Kendall−function calibration

Empirical against fitted copula probabilities

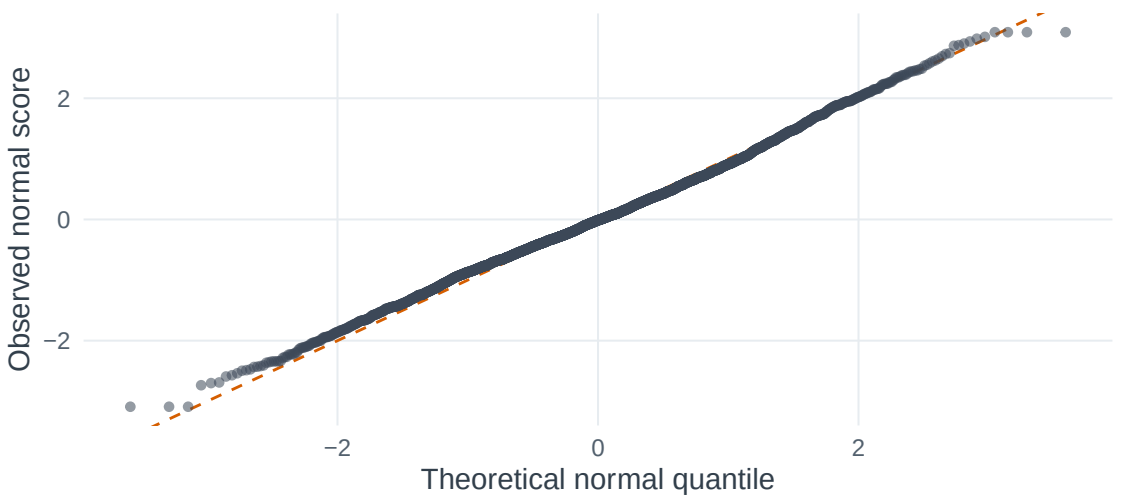

Rosenblatt Normal Scores by Time

Each time point should be centered near zero with similar spread

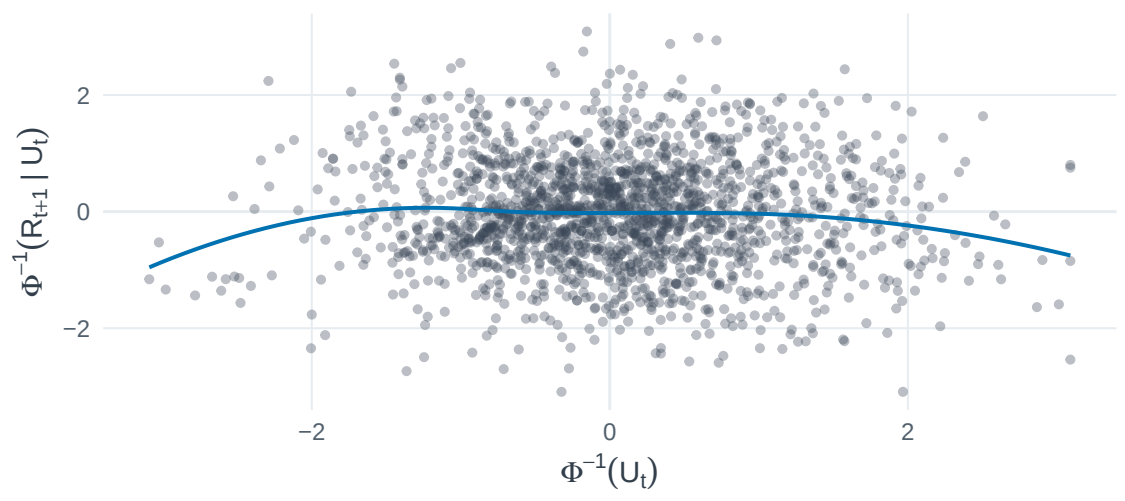

Rosenblatt normal Q−Q

Conditional scores should follow N(0, 1)

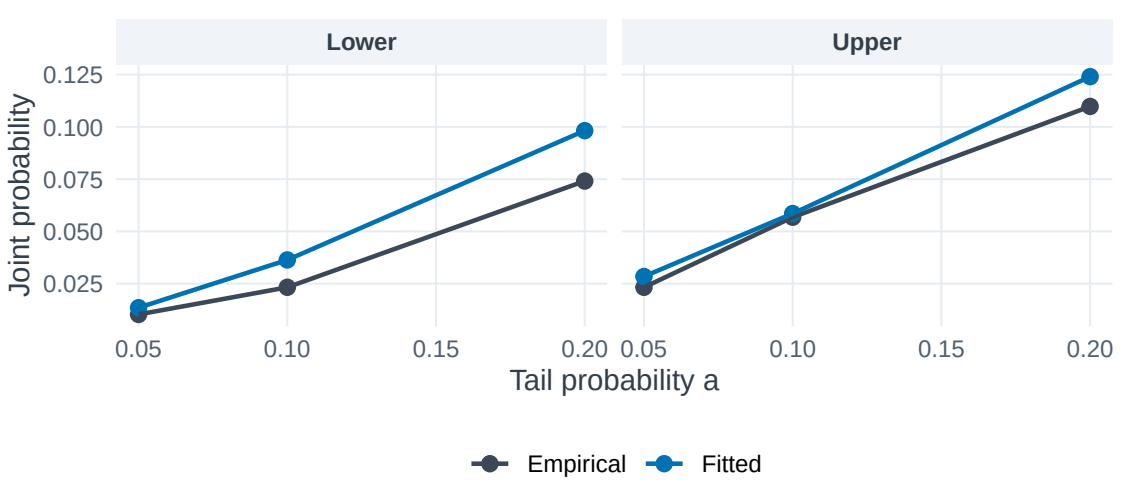

Rosenblatt Lag Plot

The smooth should be approximately flat at zero

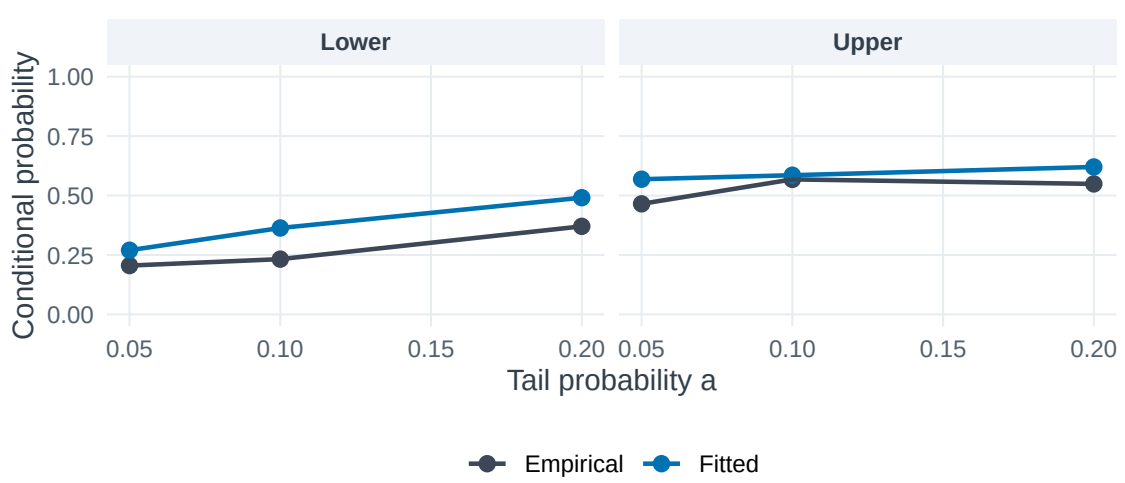

Tail Co−occurrence

Lower: P(Ut <= a, Ut+1 <= a); Upper: P(Ut >= 1−a, Ut+1 >= 1−a)

Conditional Tail Exceedance

Lower: P(Ut+1 <= a | Ut <= a); Upper: P(Ut+1 >= 1−a | Ut >= 1−a)

Residual dependence by lag

Rosenblatt−score correlations should be near zero
